Title

PERIPHERALLY SELECTIVE PIPERIDINE CARBOXYLATE  
OPIOID ANTAGONISTS

Field of the Invention

This invention relates to 3,4,4-trisubstituted-  
piperidiny-N-alkyl-carboxylates and their methods of  
use as peripheral opioid antagonists.

Background of the Invention

A substantial body of evidence indicates that  
peripheral opioid peptides and their receptors have a  
major physiological role in the regulation of gut  
motility. Consequently gastrointestinal disorders such  
as idiopathic constipation and irritable bowel syndrome  
may relate to a dysfunction of opioid receptor mediated  
control and, agents which act as antagonists for these  
receptors may benefit a patient suffering from such a  
dysfunction.

Natural and synthetic opiates such as morphine  
have been used extensively in the mediation of pain.  
However, these agents can produce undesirable side  
effects such as constipation, nausea, and vomiting which  
are peripheral to the desired action as analgesics.  
Thus, a peripheral opioid antagonist should not sub-  
stantially affect the analgesic effects of the opiate

while acting to control gastrointestinal function and to minimize the undesirable side effects of the narcotic drug.

I  
I 14  
f  
5 A number of opioid antagonists have been reported including naloxone and naltrexone (Blumberg et al., Toxicol. Appl. Pharmacol., 10, 406, 1967). Other derivatives of these compounds have been recently reported (Portoghese et al., J. Med. Chem., 31, 281-282, 1988).  
10 4-Arylpiperidines have also been reported as having analgesic activity and in some instances acting as narcotic antagonists. Zimmerman, U.S. Patent No. 4,191,771 (1980); Barnett, U.S. Patent No. 4,581,456 (1986); Zimmerman, U.S. Patent No. 4,081,450 (1978). These compounds are disclosed as having useful analgesic  
15 activity and in some cases acting as potent narcotic antagonists.

It would be advantageous to have compounds which would act as antagonists to the peripheral effects of opiate analgesics and endogenous opioid peptides. It  
20 would also be advantageous if these compounds had a minimal effect on the analgesic activity of the opiate drugs. It would be further advantageous to have compounds which can act to minimize the effects of idiopathic constipation and irritable bowel syndrome.

25 It has now been found that the N-substituted piperidines of the instant invention are useful as peripherally selective opioid antagonists. The instant compounds can also be useful in relieving the symptoms of idiopathic constipation and irritable bowel syndrome.  
30 Certain of the instant compounds are also useful as intermediates in preparing new piperidine compounds.

3

Summary of the Invention

The present invention relates to the trans-3,4-isomer of a compound of the Formula

I

wherein:

$R^1$  is hydrogen or  $C_1$ - $C_5$  alkyl;

$R^2$  is hydrogen,  $C_1$ - $C_5$  alkyl or  $C_2$ - $C_6$  alkenyl;

$R^3$  is hydrogen,  $C_1$ - $C_{10}$  alkyl,  $C_3$ - $C_{10}$  alkenyl, phenyl, cycloalkyl,  $C_5$ - $C_8$  cycloalkenyl, cycloalkyl-substituted  $C_1$ - $C_3$  alkyl,  $C_5$ - $C_8$  cycloalkenyl-substituted  $C_1$ - $C_3$  alkyl, or phenyl-substituted  $C_1$ - $C_3$  alkyl;

A is  $OR^4$  or  $NR^5R^6$ ;

wherein:

$R^4$  is hydrogen,  $C_1$ - $C_{10}$  alkyl,  $C_2$ - $C_{10}$  alkenyl, cycloalkyl,  $C_5$ - $C_8$  cycloalkenyl, cycloalkyl-substituted  $C_1$ - $C_3$  alkyl,  $C_5$ - $C_8$  cycloalkenyl-substituted  $C_1$ - $C_3$  alkyl or phenyl-substituted  $C_1$ - $C_3$  alkyl;

$R^5$  is hydrogen or  $C_1$ - $C_3$  alkyl;

$R^6$  is hydrogen,  $C_1$ - $C_{10}$  alkyl,  $C_3$ - $C_{10}$  alkenyl, cycloalkyl, phenyl, cycloalkyl-substituted  $C_1$ - $C_3$  alkyl,  $C_5$ - $C_8$  cycloalkenyl,  $C_5$ - $C_8$  cycloalkenyl-substituted  $C_1$ - $C_3$  alkyl, phenyl-substituted  $C_1$ - $C_3$  alkyl, or  $(CH_2)_q$ -B; or

or pharmaceutically acceptable salts thereof.

The present invention also provides a method for using an effective amount of the compounds of the instant invention to treat constipation, nausea or  
15 vomiting induced by the use of opiates in a patient.

In a further embodiment the instant invention provides a method for treating the symptoms of idiopathic constipation or irritable bowel syndrome.

In another embodiment the instant invention  
20 provides pharmaceutical formulations comprising an effective amount of a compound of the instant invention in combination with a pharmaceutically acceptable excipient.

### Detailed Description of the Invention

DECU 25  
PH14  
H14  
30 The term "C<sub>1</sub>-C<sub>5</sub> alkyl", as used herein, represents a branched or linear alkyl group having from one to five carbon atoms. Typical C<sub>1</sub>-C<sub>5</sub> alkyl groups include methyl, ethyl, n-propyl, iso-propyl, butyl, iso-butyl, sec-butyl, tert-butyl, pentyl and the like.

7

H14  
H14  
C  
Other such terms represent straight chain or branched alkyl groups of the specified number of carbon atoms, eg. "C<sub>1</sub>-C<sub>3</sub> alkyl" represents methyl, ethyl, n-propyl, and isopropyl.

5 The terms "C<sub>2</sub>-C<sub>6</sub> alkenyl", "C<sub>2</sub>-C<sub>10</sub> alkenyl" and "C<sub>3</sub>-C<sub>10</sub> alkenyl" refer to groups containing 2 to 6, 2 to 10, and 3 to 10 carbon atoms respectively and one double bond. The group can be branched or straight chain. Examples of such groups include 2-propenyl  
10 (-CH<sub>2</sub>-CH=CH<sub>2</sub>), 1-butenyl (-CH=CHCH<sub>2</sub>CH<sub>3</sub>) and the like.

13450  
H14  
H14  
C  
The term "cycloalkyl" represents C<sub>3</sub>-C<sub>8</sub> cycloalkyl groups such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and cyclooctyl. "Substituted C<sub>5</sub>-C<sub>6</sub> cycloalkyl" includes cycloalkyl groups  
15 substituted with C<sub>1</sub>-C<sub>3</sub> alkyl, C<sub>1</sub>-C<sub>3</sub> alkoxyl or halo.

H14  
C  
The term "cycloalkyl-substituted C<sub>1</sub>-C<sub>3</sub> alkyl" represents a linear C<sub>1</sub>-C<sub>3</sub> alkyl group substituted at a terminal carbon with a C<sub>3</sub>-C<sub>8</sub> cycloalkyl group. Typical cycloalkyl-substituted alkyl groups include cyclohexylmethyl, cyclohexylethyl, cyclopentylethyl, cyclopentylpropyl and the like.  
20

H14  
The term "C<sub>5</sub>-C<sub>8</sub> cycloalkenyl" represents and olefinically unsaturated cyclic ring having five to eight carbon atoms.

H14  
25 The term "phenylalkyl" represents a linear C<sub>1</sub>-C<sub>3</sub> alkyl chain substituted at a terminal carbon with a substituted or unsubstituted benzene ring. Typical phenylalkyl groups include phenylmethyl, phenylethyl and 3-(4-methylphenyl)propyl.

8

H14  
The term "phenyl" includes a benzene ring as well as a benzene ring substituted with one or two C<sub>1</sub>-C<sub>2</sub> alkyl groups.

5 The "4 to 6-membered N-containing heterocyclic ring" referred to herein includes aromatic and nonaromatic rings such as pyrroles and piperidines.

H  
14  
H14 B  
B  
While all of the compounds of the present invention are useful peripheral opioid antagonists, certain of the present compounds are preferred for that use. Preferred compounds of Formula I are those in which R<sup>1</sup> is hydrogen, R<sup>2</sup> is methyl; R<sup>3</sup> is cyclohexyl, cyclohexylmethyl, phenyl or benzyl; n is 1 or 2; A is OH or NH(CH<sub>2</sub>)<sub>x</sub>C(O)W where x is 1 to 3; and W is OR<sup>9</sup>, NHR<sup>11</sup> or -OR<sup>12</sup>-O-C(O)R<sup>13</sup>; wherein R<sup>9</sup> is hydrogen, C<sub>1</sub>-C<sub>5</sub> alkyl, benzyl, or substituted-cyclohexyl; R<sup>11</sup> is hydrogen or C<sub>1</sub>-C<sub>5</sub> alkyl; R<sup>12</sup> is C<sub>1</sub>-C<sub>3</sub> alkyl substituted <sup>methylene</sup> methyl; and R<sup>13</sup> is C<sub>1</sub>-C<sub>3</sub> alkyl. ~~hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl; R<sup>11</sup> is hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl; n is 1; and R<sup>12</sup> is hydrogen.~~

H  
Certain of the compounds of the instant invention can serve as intermediates in the preparation of other compounds of the invention. Compounds which are preferred are those in Formula I in which R<sup>1</sup> is hydrogen or CH<sub>3</sub>; R<sup>2</sup> is CH<sub>3</sub>; R<sup>3</sup> is cyclohexyl, cyclohexylmethyl, benzyl, or phenyl; A is OH, methoxy or ethoxy; and n is 1 or 2.

25 The piperidines of the invention as illustrated in Formula I can occur as the trans and cis stereochemical isomers by virtue of the substituents at the 3-

9

H  
H  
H  
5  
10  
and 4-positions of the piperidine ring. The term "trans" as used herein refers to  $R^2$  in position 3 being on the opposite side from the methyl group in position 4, whereas in the "cis" isomer  $R^2$  and the 4-methyl are on the same side of the ring. The present invention contemplates the individual stereoisomers as well as racemic mixtures. In the most preferred compounds of the present invention, the group  $R^2$  at the 3-position is situated on the opposite side of the ring, i.e., trans to the methyl group in the 4-position and on the same side of the ring, i.e., Zusammen or Z, relative to the higher priority phenyl group at the 4-position. These trans or Z-isomers can exist as the 3R,4R-isomer as shown in Formula II

20

10

PS  
E<sub>1110</sub>X  
or the 3S,4S-isomer of Formula III

5

10

The terms "R" and "S" are used herein as commonly used in organic chemistry to denote specific configuration of a chiral center. The term "R" refers to "right" and refers that configuration of a chiral center with a clockwise relationship of group priorities (highest to second lowest) when viewed along the bond toward the lowest priority group. The term "S" or "left" refers to that configuration of a chiral center with a counterclockwise relationship of group priorities (highest to second lowest) when viewed along the bond toward the lowest priority group. The priority of groups is based upon their atomic number (heaviest isotope first). A partial list of priorities and a discussion of stereo chemistry is contained in the book: The Vocabulary of Organic Chemistry, Orchin, et al., John Wiley and Sons Inc., publishers, page 126, which is incorporated herein by reference.

25

30

The preferred compounds of the present invention are those of Formula I in which the configuration of substituents on the piperidine ring is 3R and 4R.

//

When  $R^3$  is not hydrogen, the carbon atom attached to  $R^3$  is asymmetric. As such, this class of compounds can further exist as the individual R or S stereoisomers at this chiral center, or the racemic mixture of the isomers, and all are contemplated within the scope of the present invention. Preferably, a substantially pure stereoisomer of the compounds of this invention is used, i.e., an isomer in which the configuration at the chiral center is R or S, i.e., those compounds in which the configuration at the three chiral centers is preferably 3R, 4R, S or 3R, 4R, R.

Furthermore, other asymmetric carbons can be introduced into the molecule depending on the structure of A. As such, these classes of compounds can exist as the individual R or S stereoisomers at these chiral centers, or the racemic mixture of the isomers, and all are contemplated as within the scope of the present invention.

Preferred compounds of the instant invention include the following:

U-OCH<sub>2</sub>CH<sub>3</sub>; U-OH; G-OH; U-NHCH<sub>2</sub>C(O)NHCH<sub>3</sub>; U-NHCH<sub>2</sub>C(O)NH<sub>2</sub>; G-NHCH<sub>2</sub>C(O)NHCH<sub>3</sub>; U-NHCH<sub>2</sub>C(O)NHCH<sub>2</sub>CH<sub>3</sub>; G-NH(CH<sub>2</sub>)<sub>3</sub>C(O)OCH<sub>2</sub>CH<sub>3</sub>; G-NHCH<sub>2</sub>C(O)OH; M-NHCH<sub>2</sub>C(O)NH<sub>2</sub>; M-NH(CH<sub>2</sub>)<sub>2</sub>C(O)OCH<sub>2</sub>(C<sub>6</sub>H<sub>5</sub>); X-OCH<sub>2</sub>CH<sub>3</sub>; X-OH; X-NH(CH<sub>2</sub>)<sub>2</sub>CH<sub>3</sub>; Z-NH(CH<sub>2</sub>)<sub>3</sub>C(O)OCH<sub>2</sub>CH<sub>3</sub>; X-NHCH<sub>2</sub>C(O)OH; Z-NH(CH<sub>2</sub>)<sub>2</sub>N(CH<sub>3</sub>)<sub>2</sub>; Z-NH(CH<sub>2</sub>)<sub>2</sub>C(O)NHCH<sub>2</sub>CH<sub>3</sub>; X-OCH<sub>2</sub>(C<sub>6</sub>H<sub>5</sub>); X-N(CH<sub>3</sub>)<sub>2</sub>; Z-NH(CH<sub>2</sub>)<sub>3</sub>C(O)NHCH<sub>3</sub>; Z-NH(CH<sub>2</sub>)<sub>3</sub>C(O)NH<sub>2</sub>; Z-NH(CH<sub>2</sub>)<sub>3</sub>C(O)-NHCH<sub>2</sub>CH<sub>3</sub>; X-OCH<sub>2</sub>C(O)OCH<sub>3</sub>; X-OCH<sub>2</sub>C(O)NHCH<sub>3</sub>; and X-N(CH<sub>3</sub>)CH<sub>2</sub>C(O)CH<sub>2</sub>CH<sub>3</sub>;

15

Particularly preferred compounds of the instant invention include the following:

Z-OH; Z-NH(CH<sub>2</sub>)<sub>2</sub>C(O)OH; G-NH(CH<sub>2</sub>)<sub>2</sub>C(O)NH<sub>2</sub>;  
 G-NH(CH<sub>2</sub>)<sub>2</sub>C(O)NHCH<sub>3</sub>; G-NHCH<sub>2</sub>C(O)NH<sub>2</sub>; G-NHCH<sub>2</sub>C(O)NHCH<sub>2</sub>CH<sub>3</sub>;  
 20 G-NH(CH<sub>2</sub>)<sub>3</sub>C(O)NHCH<sub>3</sub>; G-NH(CH<sub>2</sub>)<sub>2</sub>C(O)OH; G-NH(CH<sub>2</sub>)<sub>3</sub>C(O)OH;  
 X-NH<sub>2</sub>; X-NHCH(CH<sub>3</sub>)<sub>2</sub>; X-OCH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>; X-OCH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; X-OH;  
 X-O(CH<sub>2</sub>)<sub>4</sub>CH<sub>3</sub>; X-O-(4-methoxycyclohexyl); X-OCH(CH<sub>3</sub>)OC(O)CH<sub>3</sub>;  
 X-OCH<sub>2</sub>C(O)NHCH<sub>2</sub>(C<sub>6</sub>H<sub>5</sub>); M-NHCH<sub>2</sub>C(O)OH; M-NH(CH<sub>2</sub>)<sub>2</sub>C(O)OH;  
 M-NH(CH<sub>2</sub>)<sub>2</sub>C(O)NH<sub>2</sub>; U-NHCH<sub>2</sub>C(O)OCH<sub>2</sub>CH<sub>3</sub>; and U-NHCH<sub>2</sub>C(O)OH;  
 25 wherein Z, G, X and U are as defined above.

14

P  
5,150X  
5  
The compounds of the instant invention can be named in several ways. For example the compound with the structure IIa

10  
P  
can be named trans-4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidine butanoic acid, ethyl ester or ethyl-trans-4-[4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidinyl]-2-phenylbutanoate.

P  
The piperidines of this invention form pharmaceutically acceptable acid addition salts with a wide variety of inorganic and organic acids. Typical acids used include sulfuric, hydrochloric, hydrobromic, phosphoric, hypophosphoric, hydroiodic, sulfamic, citric, acetic, maleic, malic, succinic, tartaric, cinnamic, benzoic, ascorbic, mandelic, p-toluenesulfonic, benzenesulfonic, methanesulfonic, trifluoroacetic, hippuric and the like.

25  
The compounds of the present invention can be prepared by a variety of procedures well known to those of ordinary skill in the art. The 3-substituted-4-methyl-4-(3-hydroxy- or alkanoyloxyphenyl)piperidine derivatives employed as starting materials in the synthesis of the instant compounds can be prepared by

30

15

the general procedure taught by Zimmerman in U.S. Patent No. 4,115,400 (1978), and Zimmerman et al. in U.S. Patent No. 4,891,379 (1990) both incorporated herein by reference. The starting material for the synthesis of the compounds of the present invention, (3R,4R)-4-(3-hydroxyphenyl)-3,4-dimethylpiperidine, can be prepared by the procedure of Barnett in U.S. Patent 4,581,456, herein incorporated by reference, but adjusted as described in such patent so that the  $\beta$ -stereochemistry is preferred. This process is depicted in Scheme 1, wherein  $R^{20}$  is  $C_1-C_3$  alkyl,  $R^{21}$  is  $C_1-C_6$  alkyl,  $R^{22}$  is  $C_1-C_4$  alkyl,  $R^{23}$  and  $R^{24}$  independently are  $C_1-C_3$  alkyl or, when taken together with the nitrogen atom to which they are attached, form piperidine, piperazine, N-methylpiperazine, morpholine or pyrrolidine, and J is halogen, preferably chlorine or bromine.

16

Scheme 1

p  
The first step of the above-described process involves the formation of the 3-alkoxyphenyllithium reagent by reacting 3-alkoxybromobenzene with an alkyl-lithium reagent. This reaction is typically performed  
5 under inert conditions and in the presence of a suitable non-reactive solvent such as dry diethyl ether or preferably dry tetrahydrofuran. Preferred alkylolithium reagents used in this process are n-butyllithium, and especially sec.-butyllithium. Generally, approximately  
10 an equimolar to slight excess of alkylolithium reagent is added to the reaction mixture. The reaction is conducted at a temperature between about -20°C and about -100°C, more preferably from about -50°C to about -55°C.

31  
Once the 3-alkoxyphenyllithium reagent has  
15 formed, approximately an equimolar quantity of a 1-alkyl-4-piperidone is added to the mixture while maintaining the temperature between -20°C and -100°C. The reaction is typically complete after about 1 to 24 hours. At this point, the reaction mixture is allowed  
20 to gradually warm to room temperature. The product is isolated by the addition to the reaction mixture of a saturated sodium chloride solution in order to quench any residual lithium reagent. The organic layer is  
25 separated and further purified if desired to provide the appropriate 1-alkyl-4-(3-alkoxyphenyl)piperidinol derivative.

31  
The dehydration of the 4-phenylpiperidinol prepared above is accomplished with a strong acid

18

according to well known procedures. While dehydration occurs in various amounts with any one of several strong acids such as hydrochloric acid, hydrobromic acid, and the like, dehydration is preferably conducted with  
5 phosphoric acid, or especially p-toluenesulfonic acid in toluene or benzene. This reaction is typically conducted under reflux conditions, more generally from about 50°C to about 150°C. The product thus formed is generally isolated by basifying an acidic aqueous  
10 solution of the salt form of the product and extracting the aqueous solution with a suitable water immiscible solvents. The resulting residue following evaporation can then be further purified if desired.

The 1-alkyl-4-methyl-4-(3-alkoxyphenyl)tetra-  
15 hydropyridine derivatives are prepared by a metallo- enamine alkylation. This reaction is preferably conducted with n-butyllithium in tetrahydrofuran (THF) under an inert atmosphere, such as nitrogen or argon. Generally, a slight excess of n-butyllithium is added to  
20 a stirring solution of the 1-alkyl-4-(3-alkoxyphenyl)- tetrahydropyridine in THF cooled to a temperature in the range of from about -50°C to about 0°C, more preferably from about -20°C to about -10°C. This mixture is stirred for approximately 10 to 30 minutes followed by  
25 the addition of approximately from 1.0 to 1.5 equivalents of methyl halide to the solution while maintaining the temperature of the reaction mixture below 0°C. After about 5 to 60 minutes, water is added to the reaction

31  
(

0

5 mixture and the organic phase is collected. The product can be purified according to standard procedures, but the crude product is preferably purified by either distilling it under vacuum or slurrying it in a mixture of hexane:ethyl acetate (65:35, v:v) and silica gel for about two hours. According to the latter procedure, the product is then isolated by filtration followed by evaporating the filtrate under reduced pressure.

H 10 The next step in the process involves the application of the Mannich reaction of aminomethylation to non-conjugated, endocyclic enamines. This reaction is preferably carried out by combining from about 1.2 to 2.0 equivalents of aqueous formaldehyde and about 1.3 to 2.0 equivalents of a secondary amine  $\text{NHR}^2\text{R}^2$  in a  
15 suitable solvent. While water is the preferred solvent, other non-nucleophilic solvents such as acetone and acetonitrile can also be employed in this reaction. The pH of this solution is adjusted to approximately 3.0-4.0 with an acid which provides a non-nucleophilic anion.  
20 Examples of such acids include sulfuric acid, the sulfonic acids such as methanesulfonic acid and p-toluenesulfonic acid, phosphoric acid, and tetrafluoroboric acid. The preferred acid is sulfuric acid. To this solution is added one equivalent of a 1-alkyl-4-methyl-4-(3-alkoxyphenyl)tetrahydropyridine, typically  
25 dissolved in aqueous sulfuric acid, and the pH of the solution is readjusted with the non-nucleophilic acid or

JO

a secondary amine as defined above. The pH should be maintained in the range of from about 1.0 to 5.0 with a pH of about 3.0 to 3.5 being preferred during the reaction. The reaction is substantially complete after about 1 to 4 hours, more typically about 2 hours, when conducted at a temperature in the range of from about 50°C to about 80°C, more preferably at about 70°C. The reaction is next cooled to approximately 30°C and added to a sodium hydroxide solution. This solution is extracted with a water immiscible organic solvent, such as hexane or ethyl acetate, and the organic phase, following thorough washing with water to remove any residual formaldehyde, is evaporated to dryness under reduced pressure.

The next step of the process involves the catalytic hydrogenation of the 1-alkyl-4-methyl-4-(3-alkoxyphenyl)-3-tetrahydropyridinemethanamine prepared above to the corresponding trans-1-alkyl-3,4-dimethyl-4-(3-alkoxyphenyl)piperidine. This reaction actually occurs in two steps. The first step is the hydrogenolysis reaction wherein the exo C-N bond is reductively cleaved to generate the 3-methyltetrahydropyridine. In the second step, the 2,3-double bond in the tetrahydropyridine ring is reduced to afford the desired piperidine ring.

Reduction of the enamine double bond introduced the crucial relative stereochemistry at the 3 and 4 carbon atoms of the piperidine ring. The reduction

2/

does not occur with complete stereoselectivity. The catalysts employed in the process are chosen from among the various palladium and preferably platinum catalysts.

5 The catalytic hydrogenation step of the process is preferably conducted in an acidic reaction medium. Suitable solvents for use in the process include the alcohols, such as methanol or ethanol, as well as ethyl acetate, tetrahydrofuran, toluene, hexane, and the like.

10 Proper stereochemical outcome has been found to be dependent on the quantity of catalyst employed. The quantity of catalyst required to produce the desired stereochemical result is dependent upon the purity of the starting materials in regard to the presence or  
15 absence of various catalyst poisons.

The hydrogen pressure in the reaction vessel is not critical but can be in the range of from about 5 to 200 psi. Concentration of the starting material by volume is preferably around 20 ml. of liquid per gram of  
20 starting material, although an increased or decreased concentration of the starting material can also be employed. Under the conditions specified herein, the length of time for the catalytic hydrogenation is not critical because of the inability for over-reduction  
25 of the molecule. While the reaction can continue for up to 24 hours or longer, it is not necessary to continue

the reduction conditions after the uptake of the theoretical two moles of hydrogen. The product is isolated by filtering the reaction mixture for example through infusorial earth, and evaporating the filtrate to dryness under reduced pressure. Further purification of the product thus isolated is not necessary and preferably the diastereomeric mixture is carried directly on to the following reaction.

The alkyl substituent is next removed from the 1-position of the piperidine ring by standard dealkylation procedures. Preferably, a chloroformate derivative, especially the vinyl or phenyl derivatives, are employed and removed with acid. Next, the alkoxy compound prepared above is dealkylated to the corresponding phenol. This reaction is generally carried out by reacting the compound in a 48% aqueous hydrobromic acid solution. This reaction is substantially complete after about 30 minutes to 24 hours when conducted at a temperature between 50°C to about 150°C, more preferably at the reflux temperature of the reaction mixture. The mixture is then worked up by cooling the solution, followed by neutralization with base to an approximate pH of 8. This aqueous solution is extracted with a water immiscible organic solvent. The residue following evaporation of the organic phase is then preferably used directly in the following step.

The compounds employed as starting materials to the compounds of the invention can also be prepared by brominating the 1-alkyl-4-methyl-4-(3-alkoxyphenyl)-3-tetrahydropyridinemethanamine prepared above at the 3-position, lithiating the bromo compound thus prepared, and reacting the lithiated intermediate with a methylhalide such as methyl bromide to provide the corresponding 1-alkyl-3,4-dimethyl-4-(3-alkoxyphenyl)tetrahydropyridine-methanamine. This compound is then reduced and converted to the starting material as indicated above.

As noted above, the compounds of the present invention can exist as the individual stereoisomers. Preferably reaction conditions are adjusted as disclosed by Barnett (supra) or as set forth in Example 1 hereof to be substantially stereoselective and provide a racemic mixture of essentially two enantiomers. These enantiomers can then be resolved. The preferred procedure employed to prepare the resolved starting materials used in the synthesis of these compounds includes treating a racemic mixture of alkyl-3,4-dimethyl-4-(3-alkoxyphenyl)piperidine with either (+)- or (-)-di-benzoyl tartaric acid to provide the resolved intermediate. This compound is dealkylated at the 1-position with vinyl chloroformate and finally converted to the desired 4-(3-hydroxyphenyl)piperidine isomer. This reaction scheme is represented in the following Scheme 2:

## Scheme 2

25

PSH  
P  
31  
wherein  $R^{20}$  and  $R^{22}$  are as defined above.

As will be understood by those skilled in the art, the individual enantiomers of the invention can also be isolated with either (+) or (-) dibenzoyl tartaric acid, as desired, from the corresponding racemic mixture of the compounds of the invention. Preferably the (+)-trans enantiomer is obtained.

Although the (+)trans-3,4 stereoisomer is preferred, all of the possible stereoisomers of the instant compounds are within the contemplated scope of the present invention. Racemic mixtures of the stereoisomers as well as the substantially pure stereoisomers are within the scope of the invention. The term "substantially pure" is used herein to refer to at least about 90 mole percent, more preferably at least about 95 mole percent and most preferably at least about 98 mole percent of the desired stereoisomer is present compound to other possible stereoisomers.

Intermediates and compounds with the instant invention can be prepared by reacting a 3,4-alkyl-substituted-4-(3-hydroxyphenyl)piperidine with a compound of the formula  $LCH_2(CH_2)_{n-1}CHR^3C(O)E$  where L is a leaving group such as chlorine, bromine or iodine, E is a carboxylic acid, ester or amide, and  $R^3$  and n are as defined hereinabove. Preferably L is chlorine and the reaction is carried out in the presence of a base to alkylate the piperidine nitrogen. For example 4-chloro-2-cyclohexylbutanoic acid, ethyl ester can be contacted with (3R,4R)-4-(3-hydroxyphenyl)-3,4-dimethylpiperidine

26

to provide 4-[(3R,4R)-4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidine]butanoic acid, ethyl ester. Although the ester of the carboxylic acid is preferred, the free acid itself or an amide of the carboxylic acid can be used.

60 5 In alternative synthesis, the substituted piperidine can be contacted with an  $\alpha$ -methylene alkyl ester to alkylate the piperidine nitrogen. For example, 2-methylene-3-phenylpropanoic acid, ethyl ester can be contacted with a desired piperidine to provide 2-benzyl-10 3-piperidinepropanoic acid ethyl ester.

15 Another synthetic route can involve the reaction of a substituted piperidine with a haloalkyl-nitrile. The nitrile group of the resulting piperidine alkyl nitrile can be hydrolyzed to the corresponding carboxylic acid.

20 With each of the synthetic routes, the resulting ester or carboxylic acid can be reacted with an amine or alcohol to provide modified chemical structures. In the preparation of amides, the piperidine-carboxylic acid or -carboxylic acid ester is reacted with an amine in the presence of a coupling agent such as dicyclohexylcarbodiimide, boric acid, borane-trimethylamine, and the like. Esters can be prepared by contacting the piperidine-carboxylic acid with the appropriate alcohol in the presence of a 25 coupling agent such as p-toluenesulfonic acid, boron trifluoride etherate or N,N'-carbonyldiimidazole. Alternatively, the piperidine-carboxylic acid chloride can be prepared using a reagent such as thionyl chloride, phosphorus trichloride, phosphorus pentachloride and the

40

like. This acyl chloride can be reacted with the appropriate amine or alcohol to provide the corresponding amide or ester. Examples of such reactions are provided in the appended examples.

5           The following examples are provided for purposes of illustration and are not to be construed as limiting the scope of the claimed invention.

          As used in the instant examples, the following terms have the meanings indicated. "Hobt" refers to 1-  
10   hydroxybenzotriazole hydrate. "THF" refers to tetrahydrofuran. "DMF" refers to dimethylformamide. "TEA" refers to triethylamine. "DCC" refers to dicyclohexylcarbodiimide.

14           The column chromatography procedure used involved gravitational flow with Allied Fischer silica  
15   gel (70-150 mesh). Gradient solvent procedures were employed using the solvent systems specified in the particular example. The gradient procedure involved starting the indicated solvent system and incrementally changing the solvent mixture until the indicated final  
20   solvent system was obtained. Fractions containing product were evaporated generally under reduced vacuum to provide product.

          Preparative liquid chromatography was performed with the Waters Prep LC/500 apparatus using dual silica  
25   prep pack cartridges. Gradient solvent systems were employed as listed in the particular example.

          Optical rotations were determined using methanol as the solvent.

          For those examples indicated, purification of  
30   the specified compound was accomplished by preparative,

28

centrifugal, thin layer chromatography on a Harrison Model 7924A Chromatron using Analtech silica gel GF rotors. The plate thickness and solvent system employed are indicated in the particular example

5           The hydrochloride salt of the particular compound was prepared by placing the free base into ethyl ether. While stirring this ether solution, a solution of HCl in ethyl ether was added dropwise until the base-containing solution became acidic. A precipitate  
10       formed which was filtered and dried to provide the corresponding hydrochloride salt of the free base.

          In the instant Examples Q-, X-, Z-, M-, G-, and U- are used to represent the moieties indicated hereinabove.

15

Example 1

Preparation of (+)-(3R,4R)-4-(3-hydroxyphenyl)-3,4-dimethylpiperidine [Q-H] C

cl  
P  
20           3-Bromophenol was combined with an equal molar amount of 2-bromopropane in ethanol and in the presence of potassium carbonate to provide 3-bromo-isopropoxybenzene.

31  
31  
J1  
25           The 3-bromo-i-propoxybenzene (200 g, 0.08703 mol) was combined with THF (540 ml) under nitrogen and cooled to about -75°C. n-Butyl lithium (565 ml, 0.8306 mol) was added dropwise while maintaining the mixture at less than -70°C. After 2 hours 1,3-Dimethyl-4-piperidone (106.7 g, 0.8389 mol) was added while maintaining the  
30       temperature of the mixture between -80°C and -70°C.

29

31  
14  
14  
14  
14  
5 After stirring 2 hours at  $-70^{\circ}\text{C}.$ , the reaction mixture  
was then added to 6N HCl (280 ml) while maintaining the  
temperature at  $20-25^{\circ}\text{C}.$  The pH was adjusted to 1 with  
12 N HCl. The aqueous layer containing product was  
10 separated and heptane (320 ml) was added along with 50%  
NaOH (48 ml,  $\text{pH} = 13-14$ ) and the resulting mixture  
allowed to stand overnight. The mixture was heated to  
45-50°C and the upper layer was separated. The re-  
maining aqueous layer was extracted with heptane (320 ml)  
15 at 45-50°C. The combined organic fractions were washed  
with de-ionized water (120 ml) at 45-50°C. The resulting  
organic layer was vacuum distilled at a pot temperature  
of about  $55^{\circ}\text{C}$  at 100 mmHg. Crystallization from  
heptane and drying provided 151.8 g of 3-(3-i-propoxy-  
phenyl)-1,3-dimethyl-4-hydroxypiperidine. Melting point  
75.0-76.0°C.

14  
14  
20 This 4-hydroxypiperidine (463 g, 1.758 mol)  
was combined with ethyl acetate (2275 ml) under nitrogen.  
The solution was cooled to  $0-5^{\circ}\text{C}$  and ethyl chloroformate  
(205 ml, 2.144 mol) was added while maintaining the  
temperature below  $15^{\circ}\text{C}.$  The reaction mixture was  
stirred for an additional 3 hours at room temperature.  
The mixture was then added to 5N NaOH (750 ml) with  
14 stirring ( $\text{pH} = 12-13$ ) the organic layer was separated  
25 and washed with de-ionized water. Solvent was removed  
by evaporation at  $50^{\circ}\text{C}$  to provide 591 g of a viscous oil.

This viscous oil (284.8 g) was dissolved in  
ethanol (2.6 L) and warmed to  $55^{\circ}\text{C}$  under nitrogen.  
(+)-Di-p-toluoyl-D-tartaric acid, monohydrate was added

14  
14  
14  
5 and the solution heated to reflux. After stirring overnight at room temperature, the mixture was cooled to 0-5°C before filtering. The filter cake was washed with cold ethanol, air dried for 30 minutes then vacuum dried at 45-50°C. Recrystallization from ethanol provided 201.7 g of product with a melting point of 153.5-155°C (dec). This material had a ratio of isomers by proton NMR of 97:3.

10 Product prepared in this manner (411.7 g) was added to heptane (1200 ml) and 2N NaOH (550 ml) over a 15 minute period. pH of the mixture was adjusted to about 13 with 50% NaOH and stirred until all solid had dissolved. The layers were separated and the organic layer washed with 1N NaOH (275 ml), de-ionized water  
15 (275 ml) and the saturated aqueous sodium chloride (210 ml). The organic fraction was dried over 175 g of sodium sulfate, filtered and washed with heptane (125 ml). The solvent was removed by evaporation to provide 189.4 g of a colorless viscous oil.  
20  $[\alpha]_{589}$  of -6.92° (c = 1.01, methanol).

14  
14  
33  
25 This viscous oil product (50.0 g) and decalin (250 ml) were heated at 190-195°C for 19 hr under nitrogen while removing the ethanol formed by distillation. The solution was cooled to 15-20°C under nitrogen and 1N HCl (155 ml) was added with stirring. The aqueous fraction was separated and extracted with heptane (2 x 30 ml). The pH of the aqueous layer was

14

adjusted to about 13 by adding 50% NaOH and extracted with heptane. 36.5 g of a yellow-orange liquid were removed from the organic layer.

$[\alpha]_{589} = -67.24^\circ$ .

5 This yellow-orange liquid product (19.6 g) was combined with THF (175 ml) and cooled to  $-15^\circ\text{C}$  to  $-20^\circ\text{C}$  under nitrogen. n-Butyl lithium (70.0 ml) was added with stirring over about 0.5 hr while maintaining the internal temperature at about  $-10^\circ\text{C}$  to about  $-20^\circ\text{C}$ .  
10 The mixture was stirred for another 0.5 hr at  $-10^\circ\text{C}$  to  $-15^\circ\text{C}$  and then cooled to  $-45$  to  $-50^\circ\text{C}$ . Dimethyl sulfate (7.7 ml) was added slowly over 20-30 minutes while maintaining the temperature between  $-45^\circ\text{C}$  and  $-50^\circ\text{C}$ . The mixture was then stirred for an additional  
15 30 minutes at about  $-50^\circ\text{C}$ . This reaction mixture was then added slowly to a dilute solution of aqueous ammonium hydroxide (15.5 ml aqueous ammonium hydroxide solution plus 55 ml de-ionized water) at  $0-5^\circ\text{C}$ . The mixture was warmed to  $20-25^\circ\text{C}$  over 30-45 minutes and  
20 stirred an additional 2 hrs at  $20-25^\circ\text{C}$ . The organic layer was recovered and washed with de-ionized water followed by removal of solvent by evaporation to provide 21.44 g of 4-(3-i-propoxyphenyl)-1,4,5-trimethyl-2,3-dehydropiperidine as an orange liquid.

25 This dehydropiperidine (21.2 g) and methanol (195 ml) were combined under nitrogen and cooled to  $0-5^\circ\text{C}$ . Sodium borohydride (4.2 g) was added slowly while maintaining the temperature below  $15^\circ\text{C}$ . The reaction mixture was stirred at room temperature for 3

32

hrs. Acetone (21 ml) was added to the reaction mixture and stirred for 5 minutes. A saturated solution of sodium bicarbonate (25 ml) was added and the mixture stirred for 5 minutes. The alcohols were removed by  
5 evaporation at 50°C. De-ionized water (95 ml) and ethyl acetate (95 ml) were added and the resulting mixture stirred to form a solution. Phases were separated and the <sup>aqueous</sup> ~~organic~~ phase extracted with ethyl acetate (20 ml). Combined organic fractions were washed with de-ionized  
10 water (95 ml) and the solvent removed by evaporation at 50°C to provide (+)-4-(3-i-propoxyphenyl)-1,3,4-trimethylpiperidine as a yellow liquid (20.5 g).

14 Anhydrous ethanol (75 ml) and (+)-di-p-toluoyl-D-tartaric acid, monohydrate (12.48 g) were  
15 combined and heated to 55-60°C under nitrogen. An ethanol solution of the trimethyl piperidine (8.07 g in 20 ml) was added while heating to reflux (about 75°C). De-ionized water (6 ml) was added to obtain a clear homogeneous solution which was stirred at reflux for  
20 0.5 hr. Cooling, filtering, washing with cold ethanol, and drying provided 15.07 g of (+)-4-(3-i-propoxyphenyl)-1,3,4-trimethylpiperidine•(+)-di-p-toluoyl-D-tartaric acid salt with a melting point 145-147.5°C (dec).

14  
14  
25 Toluene (1400 ml) and 2N NaOH (700 ml) were combined and cooled to 15-20°C. The piperidine-tartaric salt (395.0 grams) was added with stirring at 15-25°C and stirring continued until all solids had dissolved. The layers were separated and the organic fraction

33

60H  
14  
14  
5 washed with 1N NaOH (385 ml) and di-ionized water (385 ml). The organic fraction was filtered and the solvent removed by evaporation (50°C) to provide 164.8 g of the free base as an oil.

5  $[\alpha]_{589} = +74.18^\circ$ .

To a mixture of the free base (+)-4-(3-i-propoxyphenyl)-1,3,4-trimethyl-piperidine (25 g) in toluene (160 ml) at 80-90°C was added phenylchloroformate (17.2 g). The mixture was heated at reflux (110°C) for 2 hrs and then cooled to 45-50°C. NaOH (5 ml, 50%, in 40 ml water) was added and the mixture stirred with cooling to room temperature. After 30 minutes the layers were separated and the organic layer washed with a 1:1 mixture of methanol and 1N HCl, a 1:1 mixture of methanol and 1N NaOH, and then washed with water. Evaporation of the solvent provided 33.9 g of the phenyl carbamate as an oil.

14  
20 The phenyl carbamate (13.95 g), 48% HBr (17.4 ml) and glacial acetic acid (4.7 ml) were combined and refluxed for 18 hours. The solution was cooled to room temperature; water (50 ml) was added; and the solution was extracted 3 times with t-butyl methyl ether (30 ml aliquots). The pH of the aqueous phase was adjusted to 8.5-8.8 with 50% NaOH solution. Methanol (15 ml) was added and the pH adjusted to 10.5 with the 50% NaOH solution. The mixture was stirred for 1.5 hours, cooled to 5°C and filtered to provide the white solid (+)-trans-3,4-dimethyl-4-(3-hydroxyphenyl)-piperidine (6.86 g).

60H  
30  $[\alpha]_{365} = +380.37$  (methanol).

34

Example 2

Preparation of 3-phenyl-2-(ethoxycarbonyl)-1-propene,

N-butyl lithium (201 ml of 1.6 M) was added dropwise to diisopropyl amine (45 ml) in dry tetrahydrofuran (870 ml) at  $-78^{\circ}\text{C}$ . After stirring at this temperature for 0.5 hours ethyl-2-benzylacetoacetate (39.6 g, 0.18 M) in THF (250 ml) was added dropwise at  $0^{\circ}\text{C}$ . After stirring for 20 minutes, paraformaldehyde (35.42 g) was added at room temperature followed by stirring for one hour and refluxing for 4 hours. The reaction mixture was filtered and the liquid evaporated to dryness. The residue was dissolved in a mixture of  $\text{KHCO}_3/\text{H}_2\text{O}$  and methylene chloride (1:1) and stirred for 0.5 hours. The layers were separated and the methylene chloride layer was dried over  $\text{K}_2\text{CO}_3$  and then evaporated to dryness to yield 46.4 g of named product. This product was purified with a Prep-500 chromatograph eluting with hexane to 5% ethyl acetate/hexane gradient to yield 30 g of a clear liquid.

### Example 8

10 A. Preparation of trans-4-[(3-Hydroxyphenyl)-3,4-dimethyl-1-piperidine]-2-phenyl butanoic acid, ethyl ester hydrochloride/  $[U-OCH_2CH_3 \cdot HCl]$ ,

ethyl-4-chloro-2-phenylbutanoate (2.43 g), trans-(+)-3,4-dimethyl-4-(3-hydroxyphenyl)piperidine [Q-OH] (2.0 g),  $NaHCO_3$  (905 mg), NaI (1.53 g), and dimethylformamide (DMF) (120 ml) were combined and heated to reflux for two hours. The mixture was cooled and evaporated to dryness. The solid was taken into  $H_2O$  and the pH adjusted to 9.8 with 1N NaOH. This mixture was extracted with ethyl acetate and the organic layer dried over  $K_2CO_3$ . The solvent was removed under vacuum to provide 5 g of crude product. This product was subjected to column chromatography eluting with ethyl acetate to provide 4.0 g of material. This material was converted to the HCl salt.

Acetic acid ester (HCl salt) product of the procedure of Example 43 (750 mg) [X-OCH<sub>2</sub>CH<sub>3</sub>] , 2-aminopropane (106 mg), Hobt (243 mg) were mixed in DMF (50 ml) followed by the addition of DCC (371 mg). This mixture was stirred at room temperature for 64 hours under nitrogen. The mixture was evaporated to dryness and the residue dissolved in ethyl acetate, which was then washed two times with water and dried over K<sub>2</sub>CO<sub>3</sub>. The solvent was removed to provide 880 mg of material which was passed through a silica column eluting with ethyl acetate. Solvent Evaporation provided 450 mg of product.

pH

ms (fd) = 465 M<sup>+</sup>, and 466 M<sup>+</sup>+1

The HCl salt was formed and the white solid dried at 60°C.

15 m.p. = 124-128°C.

### Example 51

Preparation of 2-[[2-(phenylmethyl)-3-[4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidiny]-1-oxopropyl]-amino]ethanoic acid 2-propyl ester monohydrochloride,  $[X-OCH(CH_3)_2 \cdot HCl]$

Acetic acid ester (HCl salt) prepared as in Example 43 (1.0 g), isopropyl alcohol (20 ml), and 3 angstrom molecular sieve (50 mg) were combined followed by the addition of isopropyl alcohol saturated with gaseous HCl (20 ml). The reaction mixture was refluxed for 48 hours and the solvent removed. The residue was diluted with water and the pH adjusted to 9.8 with TEA. The mixture was extracted with ethyl acetate which was then dried over  $K_2CO_3$ . The solvent was removed and the residue passed through a silica column eluting with ethyl acetate. The recovered product was converted to the HCl salt to provide 700 mg of white solid after drying. The solid was triturated in ethyl acetate and filtered to yield 650 mgs of white solid.

m.p. = 75-120°C (foam):

Example 94

Preparation of X-OCH(CH<sub>3</sub>)OC(O)CH<sub>3</sub>•hydrochloride.

- 5 KOH prepared as in Example 44 (463 mg) and  
K<sub>2</sub>CO<sub>3</sub> (1.83 g) were heated at 70°C for ten minutes. The  
mixture was then cooled to room temperature and 1-  
bromoethylacetate (894 mg) in DMF (20 ml) was added  
dropwise at room temperature. After stirring one hour  
at room temperature, the solution was filtered and  
evaporated. The residue was partitioned between ethyl  
10 acetate and water with the water layer pH adjusted to  
9.8 with 1N NaOH. The layers were separated and the  
ethyl acetate layer washed one time with water, dried  
over K<sub>2</sub>CO<sub>3</sub> and evaporated to provide 620 mg of a dark  
oil. This material was passed over a silica column  
15 eluting with a gradient of hexane/ethyl acetate (v:v,  
1:1) to ethyl acetate. Removal of solvent provided 330  
mg of a dark oil which was placed over the chromatron  
using a 2 mm plate and eluting with a gradient of  
hexane/ethyl acetate (v:v, 1:1) to ethyl acetate. The  
20 resulting solution was stirred over decolorizing  
charcoal and the solvent removed to provide 200 mg of a  
tan oil having a mass spec of 511 (M<sup>+</sup> + 1). This  
product was converted to HCl salt and dried at 60°C to  
provide 190 mg of a tan solid.  
25 m.p. = 94°-98°C (with decomposition)

#### Example 98

Preparation of (-)-(3S,4S)-trans-[[2-[[4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidinyl]methyl]-1-oxo-3-phenylpropyl]amino]acetic acid [(-)X-OH of Example 85]

A. Preparation of (-)-trans-(3S,4S)-3-[4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidinyl]-2-phenylmethyl-propanoic acid ethyl ester.

The procedure of Example 97A was followed using (-)-trans (3S,4S)-4-(3-hydroxyphenyl)-3,4-dimethylpiperidine (10 g, 48 mmole) and 2-ethoxycarbonyl-3-phenylpropene (10.2 g) in methanol (500 ml). 18.31 g of a tan viscous oil was recovered. This was passed over a PREP-500 liquid chromatograph eluting with a gradient of hexane to 10% ethyl acetate/hexane to providing 17.40 g of a white foam.

ms (fd) = 395 M<sup>+</sup>

B. Preparation of (-)-(3S,4S)-3-[4-(3-hydroxyphenyl)-3,4-dimethyl-1-piperidinyl]-2-phenylmethyl-propanoic acid.

122

The procedure of Example 97B was followed with the product from Example 97A (12.5 g, 32 mmole), lithium hydroxide (3.98 g) in THF/methanol/water (400 ml/130 ml/130 ml). 10.75 g of a tan foam was recovered.

5 This was subjected to column chromatography eluting with a gradient of ethyl acetate/methanol (9:1) to ethyl acetate/methanol (1:1). Removal of the solvent provided 8.97 g of a white powder.

ms (fd) = 368 M<sup>+</sup>+1

10 C. Preparation of (-)-X-OCH<sub>2</sub>-CH(CH<sub>3</sub>)<sub>2</sub>(.)

The procedure of Example 97C was followed with the product from Example 98B (5.12 g, 14 mmole), amine from Example 96 (4.54 g), triethylamine (1.5 g), Hobt (2.0 g) DCC (3.04 g) in dry DMF (400 ml). 7.81 g

15 of an orange foam was recovered. This was passed over a silica column eluting with a gradient of hexane/ethyl acetate (9:1) to hexane/ethyl acetate (1:1). Removal of the solvent provided 5.5 g of a white foam.

ms (fd) = 481 M<sup>+</sup>

D. Separation of diastereomers.

The procedure of Example 97D was followed using 4.20 g of the (-)-isomeric mix of Example 98C.

Fractions 33-40 showed 98% of a first peak by HPLC. Removal of solvent provided 435 mg of a white

25 foam (diastereomer A).

25 The instant compounds are useful in blocking peripheral opioid receptors and preventing peripherally opiate induced side effects. These side effects induced by the administration of an opiate such as morphine to a

124

mammal can include constipation, nausea, and vomiting. These compounds can also be useful in the treatment of irritable bowel syndrome and idiopathic constipation. While not wishing to be bound by the theory, it is  
5 believed that the instant compounds act as opioid antagonists and bind to peripheral opioid receptors outside of the brain. The compounds do not substantially pass through the blood-brain barrier and therefore do not mitigate the opioid's effect on central (brain and  
10 spinal cord) opioid receptors. Consequently, these compounds should also be substantially free of other centrally mediated effects.

In order to determine in vivo opioid receptor antagonism, the mouse writhing analgesis test was used.  
15 Test compounds were measured for their ability to block morphine-induced analgesia.

Five CF-1 male mice (Charles River, Portage, MI), weighing approximately 20 g after being fasted overnight, were observed simultaneously for the  
20 writhing response. The writhing response was defined as a contraction of the abdominal musculature, followed by the extension of the hind limbs, and was induced by the intraperitoneal administration of 0.6% acetic acid in a volume of 1 ml/100 g body weight. The  
25 observation period was 10 min. in duration, beginning 5 min. after injection of acetic acid. The percent inhibition of writhing was calculated from the average number of writhes in the control (non-drug) group. Each data point is the mean ( $\pm$  standard error) for five  
30 mice. The  $ED_{50}$  was defined as the dose of agonist that

128

inhibited mean writhing by 50%. The  $AD_{50}$  was defined as the dose of antagonist that reduced the inhibition of writhing produced by a 1.25 mg/kg dose of morphine sulfate to 50%. Each mouse was only used once. All  
5 drugs were administered subcutaneously (1 ml/100 g bwt) 20 min. before the injection of acetic acid.

Determinations of peripheral opioid activity were conducted. Mice maintained (6 mice/cage) on 0.01 M saccharin water with 1 g/l morphine sulfate for a  
10 minimum of 10 days with mice averaging  $3.0^+$  g water/mouse/day for at least three days are used as subjects. The morphine water was removed 45 min. prior to injection with the proposed opioid antagonist. Initial testing consisted of 5 mice/dose of compound.  
15 The antagonist was given by the subcutaneous or oral, route of administration, and the mice were placed in 11-14" x 4 7/12 I.D. clear plastic cylinders with white paper towels used for a floor.

1433

The mice were then monitored visually for 30  
20 minutes post-injection for the presence of jumping and of diarrhea. Jumping was scored as positive if at least one jump occurred in 30 min. Diarrhea was scored as positive when feces were moist enough to stain the white paper at the base of the cylinder. After 30 minutes of  
25 testing, the mice were placed back in original cages, put back on morphine water, and not tested again for 48 hrs. Lower doses of the antagonist compounds were

126

tested until threshold doses for diarrhea were determined. Diarrhea is a peripherally mediated sign of precipitated opiate abstinence.

H  
5      The extent of the effect on peripheral activity compared to central activity of the present compounds can be determined by comparing the  $AD_{50}$  for the mouse writhing test with the  $ED_{50}$  for the mouse diarrhea test. The higher the ratio, the greater the relative antagonism of the peripheral opioid receptors by a particular  
10 compound. This ratio for each compound is provided in Table I.

P  
10 The compounds of the present invention have been found to display excellent activity in an opioid receptor binding assay which measures the affinity of the compounds to bind to mu receptors. This assay was conducted by the following procedure.

Male Sprague Dawley rats for mu site  
15 experiments were sacrificed via decapitation and the brains were removed. The brain tissue, rat whole brain minus cerebellum for mu was homogenized in a Teflon and glass tissue homogenizer. A supernatant I, pellet IV, fraction was frozen in a nitrogen freezer at 1.33 g/ml  
20 concentration and stored for not longer than five weeks prior to use. Pellets were rehydrated with physiological buffer prior to use.

H  
25 For mu sites increasing concentrations of experimental compound, [0.1 to 1000 nanomolar (nM)], Kreb-Hepes buffer pH 7.4, and tritiated naloxone (0.5 nM) (<sup>3</sup>H ligand) were combined in polystyrene tubes at room temperature. The reaction was initiated by the addition of the resuspended tissue which had been preincubated at 37°C. for 20 minutes. The reaction mixture was incubated  
30 in a 37°C. water bath for 20 minutes. The reaction was

133

terminated by rapid filtration, (Brandel Cell Harvester), through Whatman GF/B glass filters that had been presoaked in Krebs-Hepes buffer pH 7.4. The filters were then washed 2x with 5 ml of ice cold Krebs-Hepes buffer pH 7.4. Washed filters were placed in scintillation vials and 10 ml RedySolv, (Brandel), was added and samples counted in a Searle D-300 beta counter. Means and standard error statistics were calculated for triplicate experimental determinations in certain cases. The incubation time for the reaction mixture was 20 minutes at 37°C.

Ki values were calculated using a minitab statistical program according to the following formula:

7/13/0X  
15

$$K_i = \frac{IC_{50}}{1 + \frac{\text{concentration of } ^3\text{H ligand}}{K_D}}$$

PSH  
H  
I  
L  
14  
P

20 wherein IC<sub>50</sub> is the concentration at which 50% of the <sup>3</sup>H ligand is displaced by the test compounds and K<sub>D</sub> is the dissociation constant for the <sup>3</sup>H ligand at the receptor site. K<sub>D</sub> can be determined as described by Bennett, "Methods in Binding Studies", Neurotransmitter Receptor Binding, Yamamura, et al., ed., p. 57-90, Raven Press, N.Y. (1978) incorporated herein by reference.

25

The results of the evaluation of certain compounds of the present invention in the opioid receptor binding assay are set forth below in Table II. In the Table, column 1 sets forth the Example Number of the compound evaluated, column 2 the Ki

30

134

value in nanomolar (nM) at the mu receptor and columns 3 and 4 the percent displacement by the test compound at the indicated concentration, ie., 10 nM or 100 nM.

p

While it is possible to administer a compound of the invention directly without any formulation, the compounds are preferably employed in the form of a pharmaceutical formulation comprising a pharmaceutically acceptable excipient and at least one compound of the invention. Such compositions contain from about 0.1 percent by weight to about 90.0 percent by weight of a present compound. As such, the present invention also provides pharmaceutical formulations comprising a compound of the invention and a pharmaceutically acceptable excipient therefor.

In making the compositions of the present invention, the active ingredient is usually mixed an excipient which can be a carrier, or a diluent or be diluted by a carrier, or enclosed within a carrier which can be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it can be a solid, semi-solid or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the composition can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, emulsions, solutions, syrups, suspensions, aerosols (as a solid or in a liquid medium), and soft and hard gelatin capsules.

Examples of suitable excipients, include lactose, dextrose, sucrose, sorbitol, mannitol, starches,

140

gum acacia, calcium phosphate, alginates, calcium  
silicate, microcrystalline cellulose, polyvinylpyrrolidone,  
cellulose, tragacanth, gelatin, syrup, methyl cellulose,  
methyl- and propylhydroxybenzoates, talc, magnesium  
5 stearate, water, and mineral oil. The formulations can  
also include wetting agents, emulsifying and suspending  
agents, preserving agents, sweetening agents or flavoring  
agents. The formulations of the invention can be  
formulated so as to provide quick, sustained, or delayed  
10 release of the active ingredient after administration to  
the patient by employing procedures well known in the  
art.

For oral administration, a compound of this  
invention is preferably admixed with one or more ex-  
15 cipient, and molded into tablets or enclosed in gelatin  
capsules.

The compositions are preferably formulated in  
a unit dosage form, each dosage containing from about 1  
to about 500 mg more usually about 5 to 300 mg of the  
20 active ingredient. The term "unit dosage form" refers  
to physically discrete units suitable as unitary  
dosages for human subjects and other mammals, each unit  
containing a predetermined quantity of active material  
calculated to produce the desired therapeutic effect,  
25 in association with a suitable pharmaceutical excipient.

In order to more fully illustrate the  
operation of this invention, the following formulation  
examples are provided. The samples are illustrative

141

only, and are not intended to limit the scope of the invention. The formulations may employ as active compounds any of the compounds of the present invention. Specific compounds are provided as illustrative with Z, G, X.

Formulation 1

Hard gelatin capsules are prepared using the following ingredients:

		<u>Amount Per Capsule</u>	<u>Concentration by Weight (percent)</u>
15	Z-NH(CH <sub>2</sub> ) <sub>2</sub> C(O)NH <sub>2</sub>	20 mg	10.0
	starch dried	200 mg	43.0
	magnesium stearate	<u>10 mg</u>	<u>2.0</u>
20		460 mg	100.0

25 The above ingredients are mixed and filled into hard gelatin capsules in 460 mg quantities.

142

Formulation 2

Capsules each containing 20 mg of medicament are made as follows:

		<u>Amount Per Capsule</u>	<u>Concentration by Weight (percent)</u>
10	G-NH(CH <sub>2</sub> ) <sub>2</sub> C(O)NH <sub>2</sub>	20 mg	10.0
	starch	89 mg	44.5
	microcrystalline cellulose	89 mg	44.5
15	magnesium stearate	<u>2 mg</u>	<u>1.0</u>
		200 mg	100.0 mg
20	The active ingredient, cellulose, starch and magnesium stearate are blended, passed through a No. 45 mesh U.S. sieve and filled into a hard gelatin capsule.		

Formulation 3

Capsules each containing 100 mg of active ingredient are made as follows:

		<u>Amount Per Capsule</u>	<u>Concentration by Weight (percent)</u>
30	G-NH(CH <sub>2</sub> ) <sub>3</sub> C(O)NHCH <sub>3</sub>	100 mg	30.0
35	polyoxyethylene sorbitan monooleate	50 microg	0.02
	starch powder	<u>250 mg</u>	<u>69.98</u>
40		350.05 mg	100.00

143

The above ingredients are thoroughly mixed and placed in an empty gelatin capsule.

Formulation 4

Tablets each containing 10 mg of active ingredient are prepared as follows:

	<u>Amount Per Tablet</u>	<u>Concentration by Weight (percent)</u>
10		
X-OCH <sub>2</sub> CH(CH <sub>3</sub> ) <sub>2</sub>	10 mg	10.0
15		
starch	45 mg	45.0
microcrystalline cellulose	35 mg	35.0
20		
polyvinylpyrrolidone (as 10% solution in water)	4 mg	4.0
25		
sodium carboxymethyl starch	4.5 mg	4.5
magnesium stearate	0.5 mg	0.5
talc	<u>1 mg</u>	<u>1.0</u>
30	100 mg	100.0

The active ingredient, starch and cellulose are passed through a No. 45 mesh U.S. sieve and mixed thoroughly. The solution of polyvinylpyrrolidone is mixed with the resultant powders which are then passed through a No. 14 mesh U.S. sieve. The granule so produced is dried at 50°-60°C and passed through a No.

144

18 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate and talc, previously passed through a No. 60 mesh U.S. sieve, are then added to the granule which, after mixing, is compressed on a tablet machine to yield a tablet weighing 100 mg.

Formulation 5

A tablet formula may be prepared using the ingredients below:

		<u>Amount Per Capsule</u>	<u>Concentration by Weight (percent)</u>
15	X-O(CH <sub>2</sub> ) <sub>4</sub> CH <sub>3</sub>	250 mg	38.0
	cellulose microcrystalline	400 mg	60.0
20	silicon dioxide fumed	10 mg	1.5
	stearic acid	<u>5 mg</u>	<u>0.5</u>
		665 mg	100.0

The components are blended and compressed to form tablets each weighing 665 mg.

145

Formulation 6

Suspensions each containing 5 mg of medicament per 5 ml dose are made as follows:

		<u>per 5 ml of suspension</u>
	M-NHCH <sub>2</sub> C(O)OH	5 mg
10	sodium carboxymethyl cellulose	50 mg
	syrup	1.25 ml
	benzoic acid solution	0.10 ml
15	flavor	q.v.
	color	q.v.
20	water	q.s. to 5 ml

The medicament is passed through a No. 45 mesh U.S. sieve and mixed with the sodium carboxymethylcellulose and syrup to form a smooth paste. The benzoic acid solution, flavor and color is diluted with some of the water and added to the paste with stirring. Sufficient water is then added to produce the required volume.

Formulation 7

cl  
p  
5,1470X  
5

An aerosol solution is prepared containing the following components:

		<u>Concentration by Weight (percent)</u>
	U-NHCH <sub>2</sub> C(O)OH	0.25
10	ethanol	29.75
	Propellant 22 (chlorodifluoromethane)	<u>70.00</u>
15		100.00

31

20 The active compound is mixed with ethanol and the mixture added to a portion of the Propellant 22, cooled to -30°C and transferred to a filling device. The required amount is then fed to a stainless steel container and diluted further with the remaining amount of propellant. The valve units are then fitted to the

25 container.
